1. Evaluate the following integral:

$$\int \frac{2x^2+1}{x(x-1)^2}\,dx$$

Solution

We use partial fractions to simplify the integral. The partial fractions expansion is of the form

$$\begin{aligned}\frac{2x^2+1}{x(x-1)^2} = \frac{A}{x} + \frac{B}{x-1} + \frac{C}{(x-1)^2} &= \frac{A(x-1)^2 + Bx(x-1) + Cx}{x(x-1)^2} \\ &= \frac{(A+B)x^2 + (-2A-B+C)x + A}{x(x-1)^2}\end{aligned}$$

Equating coefficients of respective powers of x and solving the resulting system of equations gives values $A = 1$, $B = 1$, and $C = 3$, so

$$\begin{aligned}\int \frac{2x^2+1}{x(x-1)^2}\,dx &= \int \frac{1}{x} + \frac{1}{x-1} + \frac{3}{(x-1)^2}\,dx \\ &= \int \frac{1}{x}\,dx + \int \frac{1}{x-1}\,dx + \int \frac{3}{(x-1)^2}\,dx \\ &= \ln|x| + \ln|x-1| - \frac{3}{x-1} + C\end{aligned}$$

2. Write out, but do NOT simplify, the midpoint approximation M_4 of

$$\int_0^2 x\sin(x) + \cos(x)\,dx.$$

Calculate an error bound for this approximation using the Midpoint Rule error bound equation

$$|E_M| \leq K(b-a)^3/24n^2.$$

Solution

If we write $f(x) = x\sin(x) + \cos(x)$, then the midpoint approximation M_4 with $n = 4$ is given by

$$\frac{2-0}{4}\Big(f(1/4) + f(3/4) + f(5/4) + f(7/4)\Big).$$

To calculate the error bound, we need to find an upper bound on the second derivative of f. We calculate

$$f'(x) = x\cos(x) + \sin(x) - \sin(x) = x\cos(x),$$

and

$$f''(x) = \cos(x) - x\sin(x),$$

and we estimate

$$\begin{aligned}\big|f''(x)\big| &= |\cos(x) - x\sin(x)| \le |\cos x| + |-x\sin(x)| \\ &= |\cos x| + |x|\,|\sin x| \le 1 + 2\cdot 1 = 3.\end{aligned}$$

Thus we can use $K = 3$ as a bound on the second derivative, and this gives us an error estimate of

$$|E_M| \le 3(2-0)^3/(24\cdot 4^2) = 1/16.$$

3. Use the comparison theorem to determine whether the following improper integral is convergent or divergent:

$$\int_1^\infty \frac{e^{-x}}{\cos(x)/2+1}\,dx$$

Solution

We use the comparison theorem to show that the integral is convergent. Because $\cos(x)$ only varies between -1 and 1, we see that $\cos(x)/2 + 1$ only varies between $1/2$ and $3/2$, and in particular is at least $1/2$ for every x. Thus

$$0 \le \frac{e^{-x}}{\cos(x)/2+1} \le 2e^{-x}.$$

We can calculate

$$\int_1^\infty e^{-x} = \lim_{s\to\infty}\int_1^\infty e^{-x} = \lim_{s\to\infty}(-e^{-s} + e^{-1}) = 1/e,$$

which is convergent. Thus by the comparison theorem, we see that the given improper integral is also convergent.
